

**FOR IMMEDIATE RELEASE:**

### **aspStation Completes High Speed Internet Fiber Ring in Downtown Pittsburgh**

*Pittsburgh, PA – December 9, 2011* – aspStation has completed their latest fiber optic connectivity project, increasing their network reach from the company's Bloomfield data center into the heart of Downtown Pittsburgh. "The project serves three primary purposes," says Ed DeHart, President of aspStation, Inc. "The new fiber ring will give us faster access to Internet backbone carriers. It will provide more options on where our network can meet other carriers. We will be able to provide a better service to our clients located in the downtown area including our Downtown WiFi Pittsburgh project."

aspStations' first "on net" building is the Gulf Tower. Internet services from the connection into the Gulf building will also be made available to the building tenants. The first user of the network connection is 110 Gulf Associates, the building management firm for the Gulf Tower. "This is a great additional service that provides our tenants with another choice for Internet, Phone and even enterprise level bandwidth," said Annie Morrison of 110 Gulf Associates.

The 11-year-old aspStation maintains their original core business as a Data Center operator and Internet service provider, but has also been expanding their service offerings over the last 5 years by providing commercial VoIP phone services and their custom SoftPBX, which has been successfully deployed in two local universities.

"We continually upgrade our data center infrastructure," said Mr. DeHart. "The aspStation fiber ring into the downtown area will allow us to offer lower cost, very reliable, access to our data center network products such as Internet access, virtual Ethernet circuits, and telephone service using the latest in voice over IP technology."
